### 0.1 Single Phase AC circuit

### 0.1.1 AC circuit with a pure resistance:

Consider an electrical circuit consists of a pure resistance R with an alternating voltage $V=$ $V_{m} \sin \omega t$ as shown in the Figure 19. The current $i$ flowing in the circuit is expressed as

Figure 1

$$
i=\frac{V_{m} \sin \omega t}{R}=I_{m} \sin \omega t
$$

where $I_{m}=\frac{V_{m}}{R}$
The instantaneous power consumed by the resistance $R$ in the above circuit is

$$
\begin{aligned}
P & =v i=\left(V_{m} \sin \omega t\right)\left(I_{m} \sin \omega t\right) \\
& =V_{m} I_{m} \sin ^{2}(\omega t) \\
& =V_{m} I_{m} \frac{1-\cos 2 \omega t}{2} \\
& =\frac{V_{m} I_{m}}{2}-\frac{V_{m} I_{m}}{2} \cos 2 \omega t
\end{aligned}
$$

The equation consists of two terms. The first term is called as the constant power term. The second term is consists of $\frac{V_{m} I_{m}}{2} \cos 2 \omega t$ which is periodically varying with frequency $2 \omega$, twice the input frequency. The average power over a period of time is zero.

$$
\begin{aligned}

### 0.3 Three Phase Circuits

### 0.3.1 AC circuit with a pure resistance:

Advantages of three-phase systems :

- For power transmission, three phase transmission lines require much lesser conductor material than a single phase system.
- Three phase system is more efficient \& less expensive compared to single phase system
- Three phase machine gives higher output than a single phase machine.
- Three phase motor develops uniform torque whereas single phase motor develops pulsating torque.
- Three phase system produces rotating magnetic field with stationary coils, \& hence three phase induction motors are self starting.
- Voltage regulation is much better in three phase supply than single phase supply.

### 0.3.2 Generation of three phase power:

Three phase voltage generater is called as an alternator. The alternator consists of stator which is stationary and rotor which is rotationary part. The stator is a cylindrical in shape and has slots in its inner periphery The details of an alternator is as shown in Figure 21. The conductors are placed in the slots which are connected either in star or delta form. Rotor consists of a magnet with two poles N and S .

Three conductors $\mathrm{AA}^{\prime}, \mathrm{BB}^{\prime}$ and CC ' are electrically placed by $120^{\circ}$. When the the rotor starts rotating in clockwise, three stator conductor cuts the magnetic flux thereby an emf is induced in the conductors. The phase of the emf generated in the coils are $120^{\circ}$ with respect to other coils.

Figure 21: Three Phase generator

The voltages generated in the three coils are represented as

$$
\begin{aligned}
E_{a} & =E_{m} \sin w t \\
E_{b} & =E_{m} \sin (w t-120) \\
E_{c} & =E_{m} \sin (w t-240)=E_{m} \sin (w t+120)
\end{aligned}
$$

Figure 22: Phase sequence abc

## Phase sequence :

The phase sequence of the three phase supply is the order in which the 3 phase voltages reach their maximum values. The phase sequence either abc' or 'acb. If the maximum values of phase voltages occur in the sequence abc then the phase of the supply voltage is abc which is as shown in Figure 23. If the maximum values of phase voltages occur in the sequence acb then the phase of the supply voltage is acb which is as shown in Figure 24.

Figure 23: Phase sequence abc

Figure 24: Phase sequence acb

The phase sequence of abc is

$$
\begin{aligned}
E_{a} & =E_{m} \sin w t \\
E_{b} & =E_{m} \sin (w t-120) \\
E_{c} & =E_{m} \sin (w t-240)=E_{m} \sin (w t+120)
\end{aligned}
$$

## Importance of phase sequence:

- When the three phase supply with a particular sequence is given to three phase static load then the current will flow with the lines. If the phase sequence is changed then the direction of current flow will also change.
- When the three phase supply is given to the three phase induction motor, and if the phase sequence is changed then the direction of current flow will reverse and the direction of rotation of the motor also changes.

## Balanced three phase supply :

- If the three phase supply is having the same magnitude and are differ by $120^{\circ}$ with respect to other supply is called as balanced supply. The details of the balanced three phase supply is as shown in Figure??.
- If the three phase supply is having the different magnitude or are differ by phase angle with respect to other supply is called as unbalanced supply is as shown in Figure ??.

Figure 25: Phase sequence abc

Figure 26: Phase sequence abc

## Balanced Load :

- If the impedances in all the three phases are exactly equal in magnitude, then the load is said to be balanced load.
- If the three phase supply is having the different magnitude or are differ by phase angle with respect to other supply is called as unbalanced supply.

### 0.3.3 Three Phase Connections:

There are two types three phase load connections:

1. Star Connection (Y)
2. Delta Connection ( $\Delta$ )

## Star Connection:

The three phase star connection load as shown in Figure 27. The three phase supply voltages $V_{R Y}, V_{B R}, V_{Y B}$ are connected to the three loads with a common point known as neutral N. The voltage between any two lines is called line voltage and the voltage between line and neutral point is called as phase voltage.

Figure 27: Star Connection
The three line voltages are:
$V_{R Y}, V_{B R}, V_{Y B}$
The three phase voltages are:
$V_{R}, V_{B}, V_{Y}$

$$
\begin{aligned}
& V_{R}=V_{P} \angle 0^{\circ} \\
& V_{Y}=V_{P} \angle-120^{\circ} \\
& V_{B}=V_{P} \angle 120^{\circ} \\
& \\
& V_{R Y}= \\
& \\
&
\end{aligned}
$$

From the phasor diagram which is as shown in Figure 28

$$
V_{R Y}=\sqrt{V_{R}^{2}+V_{Y}^{2}+2 V_{R} V_{Y} \cos \angle 60^{\circ}}
$$

Let

$$
\begin{aligned}
& V_{R}=V_{Y}=V_{B}=V_{P} \\
V_{R Y} & =\sqrt{V_{P}^{2}+V_{P}^{2}+2 V_{P} V_{P} \times 0.5} \\
& =\sqrt{3} V_{P}
\end{aligned}
$$

Similarly

$$
\begin{aligned}
& V_{Y B}=\sqrt{3} V_{Y} \\
& V_{B R}=\sqrt{3} V_{B}
\end{aligned}
$$

Figure 28: Phasor diagram of balanced star system
Therefore

$$
\begin{aligned}
V_{L} & =\sqrt{3} V_{Y}=\sqrt{3} V_{P H} \\
I_{L} & =I_{P H}
\end{aligned}
$$

Power consumed by 3 phase circuit is

$$
\begin{aligned}
P & =3 \times V_{P H} \times I_{P H} \cos \phi \\
& =3 \frac{V_{L}}{\sqrt{3}} \times I_{L} \cos \phi \\
& =\sqrt{3} V_{L} I_{L} \cos \phi
\end{aligned}
$$

## Delta Connection:

The three phase delta connection load as shown in Figure 27. The three phase supply voltages $V_{R Y}, V_{B R}, V_{Y B}$ are connected to the three loads with a currents $I_{R}, I_{Y}, I_{B}$. The voltage between any two lines is called line voltage.

Figure 29: Delta Connection
The three line currents are:
$I_{R}, I_{Y}, I_{B}$

$$
I_{R}=I_{R Y}-I_{B R} \text { vector difference }
$$

From the phasor diagram which is as shown in Figure 30

$$
\begin{aligned}
& \qquad \begin{array}{l}
I_{R}=\sqrt{I_{R Y}^{2}+I_{R B}^{2}+2 I_{R Y} I_{R B} \cos \angle 60^{\circ}} \\
I_{R Y}=I_{B R}=I_{B Y}=I_{P} \\
\\
I_{R}=\sqrt{I_{P}^{2}+I_{P}^{2}+2 I_{P} I_{P} \times 0.5} \\
\\
=\sqrt{3} I_{P}
\end{array} \\
& \text { Similarly }
\end{aligned}
$$

$$
\begin{aligned}
I_{Y} & =\sqrt{3} I_{P} \\
I_{B} & =\sqrt{3} I_{P}
\end{aligned}
$$

Figure 30: Phasor diagram of balanced Delta system
In delta connection the line voltage is equal to phase voltage hence Therefore

$$
V_{L}=V_{P}
$$

Power consumed by 3 phase circuit is

$$
\begin{aligned}
P & =3 \times V_{P} \times I_{P} \cos \phi \\
& =3 V_{L} \frac{I_{L}}{\sqrt{3}} \times \cos \phi \\
& =\sqrt{3} V_{L} I_{L} \cos \phi
\end{aligned}
$$

Power Measurement by two Wattmeter method:

$$
\begin{aligned}
W_{1} & =V_{R Y} \times I_{R} \cos \left(30^{\circ}-\phi\right) \\
& =V_{L} I_{L} \cos \left(30^{\circ}-\phi\right)
\end{aligned}
$$

Reading of Wattmeter W2:

$$
\begin{aligned}
W_{2} & =V_{Y B} \times I_{B} \cos \left(30^{\circ}+\phi\right) \\
& =V_{L} I_{L} \cos \left(30^{\circ}+\phi\right)
\end{aligned}
$$

$$
\begin{aligned}
W_{1}+W_{2} & =V_{L} I_{L} \cos \left(30^{\circ}-\phi\right)+V_{L} I_{L} \cos \left(30^{\circ}+\phi\right) \\
& =V_{L} I_{L}\left[\cos \left(30^{\circ}-\phi\right)+\cos \left(30^{\circ}+\phi\right)\right] \\
& =V_{L} I_{L}\left[2 \cos \left(30^{\circ}\right) \cos (\phi)\right] \\
& =\sqrt{3} V_{L} I_{L} \cos \phi
\end{aligned}
$$

Reading of Wattmeter W1:

$$
\begin{aligned}
W_{1}-W_{2} & =V_{L} I_{L} \cos \left(30^{\circ}-\phi\right)-V_{L} I_{L} \cos \left(30^{\circ}+\phi\right) \\
& =V_{L} I_{L}\left[\cos \left(30^{\circ}-\phi\right)-\cos \left(30^{\circ}+\phi\right)\right] \\
& =V_{L} I_{L} 2 \sin 30^{\circ} \sin \phi \\
& =V_{L} I_{L} \sin \phi
\end{aligned}
$$

$$
\begin{aligned}
\frac{W_{1}-W_{2}}{W_{1}+W_{2}} & =\frac{V_{L} I_{L} \sin \phi}{\sqrt{3} V_{L} I_{L} \cos \phi} \\
& =\frac{\tan \phi}{\sqrt{3}} \\
\tan \phi & =\sqrt{3}\left[\frac{W_{1}-W_{2}}{W_{1}+W_{2}}\right] \\
\phi & =\tan ^{-1} \sqrt{3}\left[\frac{W_{1}-W_{2}}{W_{1}+W_{2}}\right]
\end{aligned}
$$

$$
\cos \phi=\cos \left[\tan ^{-1} \sqrt{3}\left[\frac{W_{1}-W_{2}}{W_{1}+W_{2}}\right]\right]
$$
